

# California Universities

John V, Eric .S

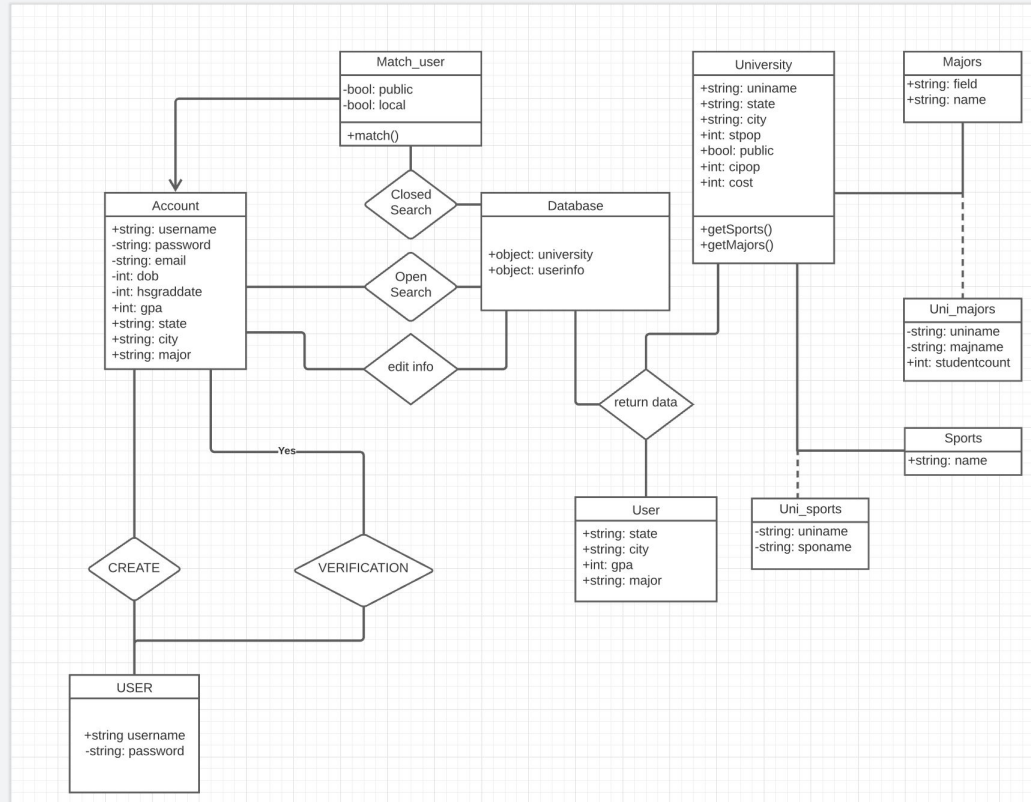

# System Description

- We built an application that implements a search through multiple California databases that searches for the perfect school for the user
- The user will be asked multiple questions.
- After answering each question the user will be given a list of schools
- This list is suppose to get smaller every time the user answers more questions.

# Use Case Diagram

# Schema and E/R diagram

---

# Implementation Details

- The databases that were used for this project was information that was manually gathered from the internet.
- We built our application by querying our database tables in python and used the terminal for user interaction
